

ABSTRACT OF THE DISCLOSURE

A data recording system for storing the voice data or other data contents of telephone calls, whereby contents of telephone calls performed using internal telephones which are connected via a switchboard to a public telephone network can be stored as data records by a telephone conversation recording apparatus, while contents of telephone calls performed using a mobile telephone can be stored on a memory card as a data record, which can be transmitted from a computer via a computer network and gateway to be stored by the telephone conversation recording apparatus in an identical way to the contents of a call performed using an internal telephone. A user can thus utilize or process the contents of a recorded telephone call in the same way, irrespective of whether the user has performed the telephone call at a remote location using a mobile telephone or by using an internal telephone.
